

1. A controller comprising:

a receiving unit for receiving a mail transmitted from a management unit;

an analyzing unit for analyzing the received mail to obtain data on an expiration date and time; and

a control unit for controlling an apparatus based on the received mail when the validity of the mail has not expired.

2. A controller as claimed in claim 1, wherein the apparatus is a copying machine.

3. A controller as claimed in claim 1, wherein the mail is transmitted in packets.

4. A management system comprising:

an apparatus;

a management unit being connected to the apparatus via a network and for transmitting data for managing the apparatus; and

a control unit being connected between the management unit and the apparatus for determining whether the validity of data transmitted from the management unit has expired or not, and for permitting transmission of data whose validity has not expired to the apparatus.

5. A management system as claimed in claim 4, wherein the apparatus

is a copying machine.

6. A management system as claimed in claim 4, wherein the network is the Internet.

5

7. A management system as claimed in claim 4, wherein the management unit transmits data in packets.

8. A control unit in which apparatus management data is transmitted and received to and from an apparatus by first communicating means, and a packet addressed to a centralized management unit is sent out to a communication network and a packet from the communication network addressed to itself is taken in by second communicating means, said control unit comprising:

10
15

counting means;

analyzing means for analyzing the packet taken in by said second communicating means; and

20

expiration date and time managing means for permitting transmission of the apparatus management data included in the packet to said apparatus on condition that a current time obtained from said counting means is not past an expiration date and time of the packet analyzed by said analyzing means.

25

9. A control unit as claimed in claim 8, wherein when the current time obtained from said counting means is past the expiration date

and time of the packet analyzed by said analyzing means, said expiration date and time managing means transmits a packet including data representing that the current date and time is past the expiration date and time to the communication network by said
5 second communicating means.

10. A control unit as claimed in claim 8, wherein said communication network is the Internet.

10 11. A control unit as claimed in claim 8, further comprising threshold value storing means for holding threshold value information deciding a period for which the apparatus management data is valid,

wherein said expiration date and time managing means
15 determines whether or not the current time is not past the expiration date and time based on a transmission date and time included in the packet analyzed by said analyzing means, the threshold value information held by the threshold value storing means and the current time obtained from said counting means.

20 12. A control unit as claimed in claim 11, wherein said threshold value storing means holds threshold value information deciding an expiration date and time of each apparatus management data.

25 13. A control unit as claimed in claim 8, wherein said expiration

1
date and time managing means determines whether or not the current
time is not past the expiration date and time based on expiration
date and time information included in the packet analyzed by said
analyzing means and the current time obtained from said counting
5 means.

14. A management system that manages apparatuses connected to a
plurality of apparatus management units by transmitting and
receiving a packet including apparatus management data between
10 a centralized management unit and the apparatus management units
via a communication network,

wherein said centralized management unit comprises:

expiration date and time setting means for setting
expiration date and time information of the apparatus management
15 data; and

communication network for sending out a packet being
addressed to a specified apparatus management unit and including
the expiration date and time information to the communication
network, and taking in a packet from the communication network
20 addressed to itself, and

wherein said apparatus management units each comprises:

first communicating means for transmitting and receiving
the apparatus management data to and from the apparatus;

second communicating means for sending out a packet
25 addressed to said centralized management unit to the

communication network, and taking in a packet from the
communication network addressed to itself;

counting means;

analyzing means for analyzing the packet taken in by said
5 second communicating means; and

expiration date and time managing means for permitting
transmission of the apparatus management data included in the
packet to the apparatus connected to said apparatus management
unit on condition that a current time obtained from said counting
10 means is not past an expiration date and time represented by the
expiration date and time information included in the packet
analyzed by said analyzing means.

15. A management system that manages apparatuses connected to a
15 plurality of apparatus management units by transmitting and
receiving a packet including apparatus management data between
a centralized management unit and the apparatus management units
via a communication network,

wherein said centralized management unit comprises:

20 counting means; and

communication network for sending out to the communication
network a packet being addressed to a specified apparatus
management unit and including a current time obtained from said
counting means as expiration date and time information, and taking
25 in a packet from the communication network addressed to itself,

and

wherein said apparatus management units each comprises:

first communicating means for transmitting and receiving the apparatus management data to and from the apparatus;

5 second communicating means for sending out a packet addressed to said centralized management unit to the communication network, and taking in a packet from the communication network addressed to itself;

counting means;

10 analyzing means for analyzing the packet taken in by said second communicating means;

threshold value storing means for holding threshold value information deciding a period for which the apparatus management data is valid; and

15 expiration date and time managing means for permitting transmission of the apparatus management data included in the packet to the apparatus connected to said apparatus management unit on condition that a current time obtained from said counting means is not past an expiration date and time obtained from
20 transmission date and time information included in the packet analyzed by said analyzing means and the threshold value information held by said threshold value storing means.

16. A controlling method comprising the steps of:

25 receiving a mail transmitted from a management unit;

analyzing the received mail to obtain data on an expiration date and time; and

controlling an apparatus based on the received mail when the validity of the mail has not expired.
